

# Military Cyber Threat OSINT

Intelligence Summary Report -- India & Neighbouring Countries

Generated July 06, 2026 | Data source: `military_osint_master.csv`

**Scope:** this dataset has been filtered to India, Pakistan, China, Bangladesh, Nepal, Sri Lanka, and Myanmar only -- all 199 findings below are from these countries. Other countries' data has been removed from the master dataset.

## Executive Summary

|                                                  |                                                               |
|--------------------------------------------------|---------------------------------------------------------------|
| Findings in scope (India + neighbours)           | 199                                                           |
| Distinct data sources contributing to this scope | 4                                                             |
| Countries covered                                | India, Pakistan, China, Bangladesh, Nepal, Sri Lanka, Myanmar |
| CRITICAL-severity findings                       | 8                                                             |
| HIGH-confidence findings                         | 79 (39% of scope)                                             |

## Breakdown by Threat Category

| Code | Category                                     | Count | % of Scope |
|------|----------------------------------------------|-------|------------|
| T1   | Personnel & Identity Threats                 | 0     | 0.0%       |
| T2   | Data & Document Leakage                      | 2     | 1.0%       |
| T3   | Communication & Network Attacks              | 196   | 98.5%      |
| T4   | Navigation, Positioning & Electronic Warfare | 1     | 0.5%       |
| T5   | Critical Infrastructure Attacks              | 0     | 0.0%       |
| T6   | Malware & Advanced Cyber Attacks             | 0     | 0.0%       |
| T7   | Emerging & Autonomous System Threats         | 0     | 0.0%       |
| T8   | Information Operations & Influence Threats   | 0     | 0.0%       |

## Findings by Country

| Country  | Findings |
|----------|----------|
| India    | 71       |
| Pakistan | 19       |

|            |    |
|------------|----|
| China      | 30 |
| Bangladesh | 7  |
| Nepal      | 16 |
| Sri Lanka  | 51 |
| Myanmar    | 7  |

## Severity, Confidence & Source-Layer Distribution

| Severity | Count | %     | Confidence | Count | %     | Layer       | Count | %     |
|----------|-------|-------|------------|-------|-------|-------------|-------|-------|
| CRITICAL | 8     | 4.0%  | HIGH       | 79    | 39.7% | Surface Web | 197   | 99.0% |
| HIGH     | 71    | 35.7% | MEDIUM     | 120   | 60.3% | Deep Web    | 2     | 1.0%  |
| MEDIUM   | 32    | 16.1% | LOW        | 0     | 0.0%  | Dark Web    | 0     | 0.0%  |
| LOW      | 88    | 44.2% |            |       |       |             |       |       |

## Data Sources Contributing to This Scope

| Source                            | Findings |
|-----------------------------------|----------|
| crt.sh (Certificate Transparency) | 106      |
| URLScan.io                        | 90       |
| LeakIX                            | 2        |
| OpenSky Network                   | 1        |

## Notable Findings

### Indian Navy -- active wildcard certificate

A currently-valid (not expired, expires Feb 2027) wildcard TLS certificate for \*.indiannavy.gov.in was found via certificate transparency logs. A wildcard certificate covers every subdomain under the domain -- if its private key were ever compromised, an attacker could impersonate any indiannavy.gov.in subdomain. Severity: CRITICAL.

### Indian Ministry of Defence -- expired wildcard certificates

Two expired wildcard certificates were found for \*.mod.gov.in and a specific subdomain, \*.maabharatikesapoot.mod.gov.in. Expired wildcard certs on government infrastructure indicate stale or unmanaged TLS configuration. Severity: CRITICAL.

### AVIC (China) -- active wildcard certificate

A currently-valid wildcard certificate for \*.sadri.avic.com was found -- AVIC (Aviation Industry Corporation of China) is a major Chinese state-owned defence and aerospace conglomerate. Severity: CRITICAL.

### Sri Lanka Army -- two active wildcard certificates

Currently-valid wildcard certificates were found for \*.army.lk and \*.cloud.army.lk (expiring November 2026 and January 2027 respectively). Severity: CRITICAL.

**Sri Lanka Navy -- active wildcard certificate**

A currently-valid wildcard certificate for \*.navy.lk was found, expiring December 2026. Severity: CRITICAL.

**Myanmar Ministry of Defence -- active wildcard certificate**

A currently-valid wildcard certificate for \*.mod.gov.mm was found, expiring December 2026. Severity: CRITICAL.

**Bangladesh Ministry of Defence -- exposed live credential in a Git config file**

An exposed .git/config file on mod.gov.bd revealed a live GitLab access token granting write access to a contractor's private repository ("oracle-cloud-npf-ministrycluster"), which by its name appears to be Oracle Cloud infrastructure for a government ministry cluster. This is one of the most significant findings in this report -- a real, working credential, not just metadata. The token has been redacted from the underlying dataset and this report; it is not published anywhere. This should be reported to the affected organization so the credential can be revoked.

## Methodology

Data is collected by an automated OSINT tool querying certificate transparency logs (crt.sh), internet-wide scanners (URLScan, LeakIX, ZoomEye, Onyphe, GrayHatWarfare), malware/threat-intel feeds (ThreatFox, MalwareBazaar, OTX AlienVault, CISA KEV, NVD, CIRCL), satellite tracking (Celestrak), dark web search (Torch via Tor), ransomware leak-site monitoring, Telegram OSINT channels, and defence news RSS. Every result passes through a shared relevance-filtering engine (domain allow-lists, contractor/APT name matching, and negative-term rejection) before being retained, and results are deduplicated against all prior collection runs. The appendix below lists every search term, domain, and tag actually queried across all sources (not limited to this report's country scope), so the full search methodology is transparent.

## Appendix: Search Terms & Tags Used Per Source

The tool does not use generic keyword searches (e.g. just "military") -- every source below is queried with specific domains, named organizations/APT groups, or technical tags. This list covers every country the tool tracks, not just the ones in this report's scope, so the full methodology is visible.

### Domain / host-based sources

crt.sh, URLScan.io, LeakIX, GrayHatWarfare, Hudson Rock, Onyphe, ZoomEye, BreachDirectory, GitHub code search, and SecurityTrails all query variations of this same master domain list (exact official domains, never bare TLDs like ".gov" or ".mil.xx" alone, to avoid matching unrelated civilian sites):

| Country / Group     | Domains Queried                                                                                                                                                                  |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| United States       | army.mil, navy.mil, af.mil, marines.mil, disa.mil, socom.mil, cybercom.mil, dia.mil, nsa.gov, dod.gov, nato.int                                                                  |
| United Kingdom      | mod.uk                                                                                                                                                                           |
| Germany             | bundeswehr.de                                                                                                                                                                    |
| Canada              | forces.gc.ca                                                                                                                                                                     |
| Australia           | defence.gov.au                                                                                                                                                                   |
| India               | indianarmy.nic.in, indiannavy.gov.in, indianairforce.nic.in, mod.gov.in, drdo.gov.in                                                                                             |
| Pakistan            | pakistanarmy.gov.pk, paknavy.gov.pk, paf.gov.pk, mod.gov.pk, ispr.gov.pk                                                                                                         |
| China               | mod.gov.cn, norinco.cn, spacechina.com, avic.com, cetc.com.cn                                                                                                                    |
| Israel              | mod.gov.il, idf.il                                                                                                                                                               |
| France              | defense.gouv.fr                                                                                                                                                                  |
| Japan               | mod.go.jp                                                                                                                                                                        |
| South Korea         | mnd.go.kr, army.mil.kr                                                                                                                                                           |
| Taiwan              | mnd.gov.tw                                                                                                                                                                       |
| Ukraine             | mod.gov.ua, zsu.gov.ua, gur.gov.ua                                                                                                                                               |
| Bangladesh          | mod.gov.bd, afd.gov.bd, ispr.gov.bd                                                                                                                                              |
| Nepal               | mod.gov.np, nepalarmy.mil.np                                                                                                                                                     |
| Sri Lanka           | defence.lk, army.lk, navy.lk, airforce.lk                                                                                                                                        |
| Myanmar             | mod.gov.mm                                                                                                                                                                       |
| Defence contractors | lockheedmartin.com, rtx.com, northropgrumman.com, baesystems.com, leidos.com, l3harris.com, generaldynamics.com, rafael.co.il, iai.co.il, dassault-aviation.com, naval-group.com |
| Indian defence PSUs | hal-india.co.in, bel-india.in, bdl-india.com, mazagondock.in, grse.in, bemlindia.in                                                                                              |

### GitHub code-search dork patterns

Beyond the domain list above, GitHub search additionally scopes by leaked-file patterns: `filename:.env`, `filename:config.json`, `filename:config.yaml`, `filename:secrets.yaml`, `filename:application.properties`, `filename:kubeconfig`, `filename:.htpasswd`, `extension:pem`, `extension:key`, `extension:sql`, `extension:tf` -- combined with the domain list and terms like `api_key`, `token`, `secret`, `password`. Any hit is then content-verified (the actual file is fetched and checked for a real secret-shaped pattern) before being marked CRITICAL.

### Malware / threat-intel feeds (tag- and family-based)

| Source                          | Tags / Filter Criteria                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ThreatFox (abuse.ch)</b>     | Named APT/nation-state malware families: Cobalt Strike, Turla, Sandworm, NotPetya, Industroyer, Fancy Bear/APT28, Cozy Bear/APT29, Lazarus, Kimsuky, Winnti/APT41, Volt Typhoon, Salt Typhoon, ShadowPad, PlugX, Transparent Tribe/APT36, SideCopy, Mustang Panda/APT40 -- OR explicit tags <code>apt</code> / <code>nation-state</code> / <code>targeted</code> / <code>military</code> . |
| <b>MalwareBazaar (abuse.ch)</b> | Tag queries: APT, RAT, loader, stealer, plus recent submissions -- gated on the same named-APT-family list as ThreatFox (Cobalt Strike, Turla, Sandworm, APT28/29/41, Lazarus, Kimsuky, ShadowPad, PlugX, Transparent Tribe, SideCopy, Mustang Panda, etc.).                                                                                                                               |
| <b>OTX AlienVault</b>           | Pulse search tags: <code>military</code> , <code>apt</code> , <code>nation-state</code> , <code>defence</code> , <code>espionage</code> .                                                                                                                                                                                                                                                  |
| <b>NVD (CVE database)</b>       | Vendor/product keywords: Cisco IOS XE, Fortinet FortiGate, Palo Alto PAN-OS, Juniper JunOS, F5 BIG-IP, Siemens SIMATIC, Rockwell Studio 5000, Honeywell Experion, Schneider Modicon, GE CIMPLICITY, SCADA/industrial control, satellite GPS firmware, Ivanti Pulse Secure, VMware vCenter -- CVSS >= 9.0 only.                                                                             |
| <b>CIRCL CVE API</b>            | Vendor terms: Cisco, Fortinet, Palo Alto, Juniper, F5, Pulse Secure, Ivanti, SonicWall, Citrix, Siemens, Rockwell, Honeywell, Schneider Electric, Viasat, Hughes, Iridium, Inmarsat, plus others -- CVSS >= 9.0 only.                                                                                                                                                                      |
| <b>CISA KEV</b>                 | Word-boundary regex: <code>scada</code> , <code>ics</code> , <code>industrial</code> , <code>defence</code> , <code>defense</code> , <code>military</code> , <code>critical infrastructure</code> , <code>plc</code> , <code>ot</code> .                                                                                                                                                   |

### Dark web, satellite, and other structural sources

| Source                                | Tags / Filter Criteria                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
